Safety Precautions

For your safety, please read the user’s manual before using products, and observe all precautions listed therein.

Our continuing program of product improvement makes specifications subject to change without notice. Data given in this catalog is for reference only, and is not guaranteed. Formal specification sheets are available upon request.
An environmentally friendly membrane gas dryer that does not require any power supply or maintenance.

What is FORBLUE™ sunsep™?

The sunsep™ dryer is made from fluoropolymer-based hollow fiber membranes. Simply requiring the supply of humidified gas to the inside of the hollow fiber membrane and dry (purer) gas to the outside, this clean and compact product allows only moisture to permeate through the membrane, efficiently dehumidifying or humidifying the target gas as required.

How does sunsep™ work?

The fluoride resin, one of the raw materials of sunsep™, has an affinity to water molecules. When there is a gradient in the partial pressure of the water vapor the gases passing outside and inside the hollow fiber membrane, it generates a force to equalize the concentration in the membrane. This driving force causes the moisture contained in the wet gas to permeate continuously to the dry gas side.

Dehumidification starts by connecting the product to the piping. The product can be used with any machines and devices that use compressed air.

Dehumidification starts by connecting the product to the piping. The product can be mounted in any position.

Only moisture is selectively removed from the gas, with hardly any effect on the gas components to be measured.

Features

- Dehumidification starts simply by connecting the product to the piping.
- The product can be used with any machines and devices that use compressed air.
- Compact and lightweight units can be mounted in any location, and in any position.

Dehumidification of sample gas

- Dehumidification starts simply by connecting the product to the piping.
- The product can be mounted in any position.
- Only moisture is selectively removed from the gas, with hardly any effect on the gas components to be measured.

Features

- SWB/SWC/SWF Series

Humidification of micro flow rate gases

- SWT series products are sheathed in polymer netting for use with micro flow rates.
- Products are available in any length, and can be used with a wide variety of connectors.

Features

- AQUADRIVE™ Series

Please contact us to discuss special requirements for humidifying models, custom specifications, and OEM products, etc.
Dehumidification starts simply by connecting the product to the piping. The product can be used with any machines and devices that use compressed air.

Compact and lightweight units can be mounted in any location, and in any position.

### Operating Conditions

- **Inlet gas pressure**: ~20 to +55°C (Do not freeze)
  - To maintain optimal dehumidification performance, we recommend that you minimize the difference between inlet (Tinlet) and ambient (Tambient) temperatures, and operate within the following range:
  - | Tinlet - Tambient | ≦9°F |
  - | Tinlet - Tambient | ≦5℃ |

- **Ambient temp**: ~20 to +55°C (Do not freeze)
- **Inlet fluid pressure**: Supply Gas: 0 to 0.85MPa (supi)
  - 0 to 120 psig
- **Purge gas**: 0 to 0.05MPa (supi)
  - 0 to 7 psig

Operating Precautions

Supplpy Gas

- To remove drainage, dust, etc., we recommend installing a filter (pore size 5 μm) and an automatic drain system at the supply gas inlet. Dehumidification efficiency may decrease if drainage is mixed into the supply gas.
- When using a lubricated compressor, we recommend installing an automatic oil mist separator at the supply gas inlet side with filtration of <0.3 μm, 95% particle size collection rate, and oil-mist concentration of <1 mgf/Nm³.
- Supply gas should be clean and free of dust, corrosive gases, organic solvents and chemicals.
- When installing a pressure-reducing valve, we recommend installing the valve at the outlet side of the dryer to improve dehumidification efficiency.

Purge Gas

- Purge gas is used to purge permeated water vapor from the outside of the hollow fiber membrane.

Purge Rate

The ratio of purge gas flow rate to supply gas flow rate is referred to as the purge rate.

The typical purge gas flow ratio for sunsep™ is about 10-20% of the supply gas flow rate. In other words, 80-90% of the supply gas flow rate produces dehumidified gas.

- Excessive pressure should not be applied to the purge gas inlet and outlet (max. 0.05 MPa (Gauge)) (max. 7.1 psig).
- For operation with a small amount of purge gas, (less than 10/ min(ANR) (0.35 scfm)), we recommend installing a small-aperture fixed orifice rather than a needle valve.

Typical Examples

SWB & SWF Series

Excluding SWB-10-150, SWB-17-200

SWC Series

Excluding SWC-M04-70/OP
Models with Built-in Purge Circuits

- Models SWB-10-150, SWB-17-200 and SWC Series (excluding SWC-M04-70/OP) have built-in purge circuits.
- With these models, a portion of the supply gas is automatically fed to the purge gas circuit. This eliminates the need for an outside purge line, simplifying installation and use.
- Purge gas can be discharged from the lower part of the housing or from the purge gas outlet. It is also possible to direct purge gas elsewhere by connecting a pipe to the outlet.

Models with Built-in Purge Circuits: Purge Gas Flow Rates

The purge gas flow rates of models with built-in purge circuits is determined as per the following table according to the inlet pressure of the supply gas. (Rates fluctuate slightly according to supply gas inlet temperature and ambient temperature). For purge gas flow rates at other pressures, contact us.

- It is possible to adjust the circuit to achieve the desired purge flow rate at the designated pressure. Please contact us to discuss your specific requirements.
- The SWC-01, 02 and 03 Series models feature a Purge Dial. Purge flow rates for each of the three settings of the dial at each pressure level are shown in the following table.

Model with Built-in Purge Circuit: Purge Gas Flow Rate

**Ambient temp**

To maintain optimal dehumidification performance, we recommend that you minimize the difference between inlet \( \Delta T_{\text{inlet}} \) and ambient \( \Delta T_{\text{ambient}} \) temperatures, and operate within the following range:

\[
\begin{align*}
\Delta T_{\text{inlet}} - \Delta T_{\text{ambient}} &\leq 5^\circ\text{C} \\
\Delta T_{\text{inlet}} - \Delta T_{\text{ambient}} &\leq 9^\circ\text{F}
\end{align*}
\]

- **Supply Gas**: -0.04 to 0.5 MPa (Gauge) at 25°C (-6.0 to + 72 psig at 77°F)
- **Purge Gas**: -0.04 to 0.05 MPa (Gauge) at 25°C (-6.0 to + 7.2 psig at 77°F)

**Inlet Fluid Pressure Range**

**SWG-035, 100 series**

#### DEHUMIDIFICATION PERFORMANCE

- Supply Gas Pressure: Approx. atmospheric pressure
- Supply Gas Temperature: 30°C (86°F)
- Atmospheric dew point of purge gas: -40°F (40°F)
- Purge Gas Flow rate: double supply gas flow rate

### Typical Examples

#### Using all sample gas as purge gas
- Effective if the sample gas flow rate is relatively low.
- The sample gases lose pressure as it passes through the analyzers. This pressure loss should be considered in determining the appropriate supply pressure.

#### Using a portion of the sample gas as purge gas
- Effective if the sample gas flow rate is relatively high.

#### Supplying purge gas separately
- Effective if instrumentation air or dried nitrogen gas is supplied separately.
- Shows stable performance even if the supply pressure is lower than that of examples 1 and 2.
- Dehumidification performance depends on the dryness of the supplied purge gas.

#### Vacuum purge line
- Sample schematic:

  - The purge gas outlet should be open to the atmosphere or decompressed.
  - Purge gas and sample gas should be removed to a treatment facility or a safe location.
  - Be sure to install the purge gas flow rate control valve upstream of the purge gas inlet.

#### In all cases:
- The purge gas outlet should be open to the atmosphere or decompressed.
- Purge gas and sample gas should be removed to a treatment facility or a safe location.
- Be sure to install the purge gas flow rate control valve upstream of the purge gas inlet.
The SWT series features sunsep™ dehumidification tubes sheathed in polymer netting.

This structure allows micro flow rate gases to freely exchange moisture with the ambient environment while protecting the hollow fiber dehumidification tube.

### DEHUMIDIFICATION PERFORMANCE

Supply Gas Pressure Dew Point: 20°C (68°F)
Ambient Temperature: 20-25°C (68 to 77°F)
Ambient Humidity: RH 13% or less

#### Pressure Drop

![Pressure Drop Graph]
NOTES

What is a "Dew Point"?

Dew point is defined as the temperature at which air that contains water vapor begins to condense. The term is often used as an indicator of the degree of dryness of a wet gas. The lower the dew point, the less water vapor is included, which means a higher degree of dryness.

How Is the Dew Point Decreased?

Methods to lower the dew point, or increase the dryness of dehumidified air with the use of the sunsep™ module, are as follows:

- Lower the temperature of the supply gas at the inlet. (Reduce the load of water vapor on the module.)
- Increase the pressure of the supply gas.
- Lower the flow rate of the supply gas.
- Decrease the product dry gas flow rate.
- Increase the purge gas flow rate.

How Is the Purge Gas Flow Rate Decided for a Fluctuating Dehumidified Gas Flow?

One of the characteristics of the sunsep™ membrane is that its components retain water, making it possible to equalize dehumidification performance even with large load fluctuations and a relatively short cycle time. The purge gas flow rate can therefore be selected using the average load of the product gas flow rate.

Clean Humidification

Another characteristic of the sunsep™ hollow fiber membrane is that it moves moisture toward the drier of the gases flowing inside and outside the membrane. For example, if dry gas is supplied to the inside of the hollow fiber membrane and humidified gas or purified water is supplied to the outside, the gas on the inside of the membrane will be humidified. (Fluids other than gases can be used – please contact us for details.)

In addition, the materials used in sunsep™ hollow fiber membranes are highly selective for water vapor (water molecules). Since permeation of gas components other than water vapor is extremely low, it is possible to humidify even when different gases flow on either side of the membrane with virtually no impact on the composition of either gas. This illustrates how sunsep™ can be used as a clean humidifier.

CUSTOM MADE

Sunsep™’s unique gas dehumidification/humidification technologies are used in a wide variety of fields and applications. If you don’t see a product that meets your needs in our catalog, please feel free to contact us about custom products, prototypes, and OEM products.

- Modules with non-standard joints/shapes
- Large-scale gas humidification modules
- Manufacturing and supply of OEM modules

See page 22 for contact information.
